Using SOP8/MSOP8 package
1A Linear Li-Ion Battery Charger

General Description

The ZCC4056 is a complete constant current & constant voltage linear charger for single cell lithium-ion batteries. Its SOP/MSOP package and low external component count make the ZCC4056 ideally suited for portable applications. Furthermore, the ZCC4056 is specifically designed to work within USB power specifications.
No external sense resistor is needed, and no blocking diode is required due to the internal MOSFET architecture. Thermal feedback regulates the charge current to limit the die temperature during high power operation or high ambient temperature. The charge voltage is fixed at 4.2V, and the charge current can be programmed externally with a single resistor. The ZCC4056 automatically terminates the charge cycle when the charge current drops to 1/10th the programmed value after the final float voltage is reached.
When the input supply (wall adapter or USB supply) is removed, the ZCC4056 automatically enters a low current state, dropping the battery drain current to less than 2uA. The ZCC4056 can be put into shutdown mode, reducing the supply current to 50uA.
Other features include Battery temperature monitor, under-voltage lockout, automatic recharge and two status pins to indicate charge and charge termination.

Applications

- Cellular Telephones, PDAs, MP3 /MP4 Players
- Charging Docks and Cradles
- Bluetooth 、GPS Applications

Features

- Programmable Charge Current Up to 1200mA
- Wide input voltage：4.25V to 10V
- No MOSFET, Sense Resistor or Blocking Diode Required
- Complete Linear Charger in SOP/MSOP Package for single Cell Lithium-Ion Batteries
- Constant-Current/Constant-Voltage Operation with Thermal Regulation to Maximize Charge Rate Without Risk of Overheating
- Charges Single Cell Li-Ion Batteries Directly from USB Port
- Preset 4.2V Charge Voltage with ±1% Accuracy
- Charge Current Monitor Output for Gas Gauging
- Automatic Recharge
- Charge state pairs of output, no battery and fault status display
- C/10 Charge Termination
- 50uA Supply Current in Shutdown
- 2.9V Trickle Charge Threshold
- Soft-Start Limits Inrush Current
- Battery temperature monitoring function
- Available in SOP8-PP/ MSOP8-PP Package

Package

Pin Description

Pin No.	Pin Name	Pin Function
1	TEMP	Battery temperature detection input.
2	PROG	Charge Current Program, Charge Current Monitor and Shutdown Pin.
3	GND	Ground.
4	VCC	Positive Input Supply Voltage.
5	BAT	Charge Current Output.
6	STDBY	The completion of battery charging instructions side.
7	CHRG	Open-Drain Charge Status Output.
8	CE	Chip enable input.

Pin Function

TEMP (Pin 1): Battery temperature detection input. TEMP pin to receive the battery NTC sensor output. If the TEMP pin voltage is less than the input voltage is greater than 45% or 80% of the input voltage means the battery temperature is too low or too high, then the charge has been suspended.
If the TEMP direct access GND, battery temperature detection canceled, the other charged and functioning properly.

PROG (Pin 2): Charge Current Program, Charge Current Monitor and Shutdown Pin. The charge current is programmed by connecting a 1% resistor, RPROG, to ground. When charging in constant-current mode, this pin servos to 1V. In all modes, the voltage on this pin can be used to measure the charge current using the following formula:
IBAT = (VPROG/RPROG) ·1200. mA
The PROG pin can also be used to shut down the charger. Disconnecting the program resistor from ground allows a 3uA current to pull the PROG pin high. When it reaches the 1.21V shutdown threshold voltage, the charger enters shutdown mode, charging stops and the input supply current drops to 50uA. This pin is also clamped to approximately 2.4V. Driving this pin to voltages beyond the clamp voltage will draw currents as high as 1.5mA. Reconnecting RPROG to ground will return the charger to normal operation.

GND (Pin 3): Ground.

VCC (Pin 4): Positive Input Supply Voltage. Provides power to the charger, VCC can range from 4.25V to 10V and should be bypassed with at least a 10uF capacitor. When VCC drops to within 30mV of the BAT pin voltage, the ZCC4056 enters shutdown mode, dropping IBAT to less than 2uA.

BAT (Pin 5): Charge Current Output. Provides charge current to the battery and regulates the final float voltage to 4.2V. An internal precision resistor divider from this pin sets the float voltage which is disconnected in shutdown mode.

STDBY (Pin 6): The completion of battery charging instructions side. When the battery charge is complete, STDBY pulled low by internal switches, indicating the completion of charging. In addition, STDBY pin will be in a high-impedance state.

CHRG (Pin 7): Open-Drain Charge Status Output. When the battery is charging, the CHRG pin is pulled low by an internal N-channel MOSFET. When the charge cycle is completed, CHRG pin will be in a high-impedance state.

CE (Pin 8): Chip enable input. High input level would ZCC4056 is in normal working condition; low input level so that ZCC4056 is prohibited charging status. CE pin can be TTL or CMOS level-level driver.

TEMP(PIN 1) 配置参考：

不使用电池温度检测时,将NTC直接接地。

带有电池温度检测10K NTC的应用，可以配置如下：

R1=6.2K R2=100K

00 摄氏度时R2 的有效值为 24.3K TEMP=79.6% 接近低温关闭

25 摄氏度时R2 的有效值为 9.09K TEMP=59%

40 摄氏度时R2 的有效值为 5.03K TEMP=46.1% 接近关闭温度

42 摄氏度时R2 的有效值为 4.67K TEMP=42.96 % 关闭输出

此NTC保证为25摄氏度时10K阻值。 R2有效值：R2与NTC并联的有效阻值,R1和R2为精密电阻
